

IDC-222 Assignment

Data Visualisation: Holocaust Jewish Casualties

Fake claim vs Evidence-based studies

Topic:

Holocaust Jewish Casualties: Evidence-Based Estimates vs Common Misconceptions

Relevance of the Topic to Data Visualisation:

The Holocaust is one of the most thoroughly documented events in history, with the Jewish death toll consistently estimated at approximately 6 million by independent studies, Nazi records, demographic analyses, and survivor data. However, denial claims often misuse partial documents (like a misrepresented Red Cross/Arolsen Archives figure of ~271,000) to suggest much lower totals. Data visualisation is a powerful way to compare raw numbers from primary sources against widely circulated misconceptions. Data visualisation demonstrates the vast gap between debunked claims and consensus evidence, highlighting how selective data interpretation creates myths.

Details of the proposed data visualisation:

A **grouped bar chart** created in Python with pandas, Matplotlib, and Seaborn. It directly contrasts:

- The commonly misused "fake" figure (271,301 from a 1979 Arolsen Archives/Red Cross document covering *only* issued death certificates for registered prisoners in 13 specific concentration camps—not the full Holocaust).
- Evidence-based estimates from peer-reviewed historical studies and Nazi documents.

Data:

Source/Claim	Estimated Jewish Deaths
Arolsen Document (Common Denial Claim)	271,301
Raul Hilberg (1961 classic study)	5,100,000
USHMM & Multiple Historians (Consensus)	6,000,000
Wolfgang Benz (German historian)	5,750,000 (mid-range)

- **X-axis:** Sources.
- **Y-axis:** Estimated deaths.
- **Colours:** **Red** for the misrepresented claim; **Blue** for evidence-based studies.

Code For Data Visualisation:

```
import pandas as pd
import matplotlib.pyplot as plt
import seaborn as sns

data = {
    'Source': ['Arolsen Document', 'Raul Hilberg', 'USHMM Consensus', 'Wolfgang Benz'],
    'Deaths': [271301, 5100000, 6000000, 5750000],
}

df = pd.DataFrame(data)

plt.figure(figsize=(8, 7))
ax = sns.barplot(x='Source', y='Deaths', data=df, palette=['red', 'blue', 'blue', 'blue'])

plt.title('Holocaust Jewish Death Toll:\nEvidence-Based Studies vs Common Misconceptions', fontsize=13, pad=20)

plt.ylabel('Estimated Number of Jewish Victims', fontsize=12)
plt.xlabel('Source', fontsize=12)

plt.yticks([0, 1000000, 2000000, 3000000, 4000000, 5000000, 6000000, 7000000],
           ['0', '1000000', '2000000', '3000000', '4000000', '5000000', '6000000', '7000000'])

for p in ax.patches:
    height = p.get_height()
    ax.text(p.get_x() + p.get_width()/2., height + 180000,
            f'{int(height):,}',
            ha='center', va='bottom', fontsize=11, fontweight='bold')

plt.savefig('holocaust_death_toll_simple.png', dpi=300, bbox_inches='tight')
plt.show()
```

Image(Visualisation):
